                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel method for extracting a nucleic acid or protein using a dendrimer having an amino group. The multilayer dendrimer is generated on the surface of a microparticle and displays a number of amino groups on its outer surface. The method of the invention may be useful for extracting a nucleic acid or protein. The current sequence is that of the PCR primer 1 of the invention which was used to amplify DNA from a human blood sample.
                                                                                                                                                                                                                             Lyst1; mouse; ly

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This oligonucleotide comprises a forward primer sequence for novel sequence tagged site (STS) D13Sfk14. It produces a 78 bp amplicon when used with a D13Sfk14 reverse primer (see AAT74240). Novel STS were isolated from murine beige (bg) critical region yeast artificial chromosomes by interspersed repetitive element (IRB) PCR (D13Sfk1-D13Sfk1) or by direct selection (D13Sfk1-D13Sfk1). Characterisation of the bg critical region in murine chromosome 13 and positional cloning of bg were performed as an antecedent to identification of the homologous human gene LYST1 (see AAT74201), which is mutated in human Chediak-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAF05468 standard; DNA; 17 BP

     The present invention protein 1 (hGDMLP-1).
1 can be used in gene
                                                                                                                                                               New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        muscle; myosin;
skeletal muscle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, ER3/COUP-TP-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           25-MAY-2001; 2001WO-US016981
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   06-DEC-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; genome-derived myosin-like protein 1; GDMLP-1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human GDMLP-1 17-mer scanning

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           and/or amount specifically of hoDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hoDMLP-1 production, and in vaccines or for replacement therapy. The polymucleotide sequences encoding hoDMLP-1 may be used for diagnosing a disorder associated with the expression of hoDMLP-1, in particular heart and skeletal muscle disorders. hoDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hoDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; genome-derived myosin-like protein 1; GDMLP-1; muscle; myosin; chromosome 22; gene therapy; vaccine; skeletal muscle disorder; amplicon; screening; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ई
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a human genome-derived myosin-like CC protein 1 (hGpMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 cC nucleic acids can be used as probes to detect, characterise and quantify cc provide initial substrates for the recombinant engineering of hGDMLP-1 cC protein variants having desired phenotypic improvements, and for cexpressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 cc used as immunogens to raise antibodies that specific biomolecule capture proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule cc capture probes for surface-enhanced laser desorption ionisation, as condition, and in vaccines or for replacement therapy. The conjunction, and in vaccines or for replacement therapy. The collaborate supplement in pattients having specific deficiency in hGDMLP-1 collaborate associated with the expression of hGDMLP-1, in particular heart collaborate associated with the expression of hGDMLP-1, in particular heart cand skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an ollgomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed consentication, but was obtained in electronic format directly from WIPO cat figure as the printed consentication, but was obtained in electronic format directly from WIPO cat figure as the printed consentication of the present invention. N.B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

CC protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 CC 1 can be used in gene therapy and vaccine production. The hGDMLP-1 CC nucleic acids can be used as probes to detect, characterise and quantify CC hGDMLP-1 nucleic acids in samples, as amplification substrates, to CC provide initial substrates for the recombinant engineering of hGDMLP-1 CC protein variants having desired phenotypic improvements, and for CC expressing the proteins. The hGDMLP-1 proteins or polypeptides may be CC used as immunogens to raise antibodies that specifically recognise hGDMLP construction as standards in assays used to determine the concentration conflict proteins, as standards in assays used to determine the concentration concentration construction and/or amount specifically of hGDMLP proteins, as specific biomolecule copure probes for surface-enhanced laser description ionisation, as concentration, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The concentration of production, and in vaccines or for replacement therapy. The concentration is skeletal muscle disorders. hGDMLP-1 may be used for diagnosing a CC disorder associated with the expression of hGDMLP-1, in particular heart conditions are present and oligomer used in the screening of the hGDMLP-1 sequence in the expression of the present invention. N.B. CC The present sequence in this patent did not form part of the printed cast for this patent did not form part of the printed content was obtained in electronic format directly from WIPO as feed in the expense of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    30-JAN-2001;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            acid, where the oligonucleotide binds in a parallel and antiparallel orientation, respectively, to target sequences on alternate strands of the double helical nucleic acid. The method has therapeutic applications, where gene expression is controlled by selective triple-helix formation within expression regulatory sequences of a target gene. The oligonucleotides can be used to form triple-helices, and are useful to detect the presence or absence of specific sequences within genomic DNA for diagnostic and therapeutic purposes. The oligonucleotides can be selected to specifically bind to pathogenic double-stranded DNA for diagnostic and therapeutic purposes. The oligonucleotide on be selected to specifically bind to pathogenic bacteria or viruses for replication or virulence, reducing their pathogenicity. Alternatively, the oligonucleotide can be chosen to target a unique sequence of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            pathogen which is not found in the genome of pathogen's host. The oligonucleotides can be used in cancer treatment by way of triple-helix suppression of specific oncogenes including those of endogenous or viral origin. Such therapeutic oligonucleotides are capable of forming triple-helices with such sequences in cancerous cells containing the activated oncogene, so preferentially killing or repressing the cancer causing cell. The present sequence represents an oligonucleotide used in the methods of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to methods and oligonucleotides for forming a triple-helix comprising a double helical nucleic acid comprising first and second substantially complementary strands, and an oligonucleotide bound to a purine-rich target sequence within the double helical nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A triple-helix comprising a double helical nucleic acid (DHNA) and an oligonucleotide which binds in parallel and antiparallel orientation, respectively, for targetting sequences on alternate strands of DHNA to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cc incleotides, a sequence that hybridizes under stringent conditions with concludes. The nucleotides are used as probes or primers for detecting, clantifying, quantifying and/or amplifying nucleic acids, as in vitro conservations, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour currently of the polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and compared to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and compared to prepare transgenic animals, as experimental infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

Cc Analysis of the expression of the nucleotides can be used for diagnosis can and/or prognosis of these diseases. The nucleotides and polypeptides can also be used to screen for their specific interactive molecules, potentially useful for treating diseases associated with abnormal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to the isolation of 6327 nucleotide sequences, rragments of at least 15 consecutive nucleotides of these nucleotides, sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 17

The invention may therefore be useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizohrenia. The present sequence is that of a nucleic acid sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO are format in the printed are found in the printed are controlled to the printed are controlled are controlled
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; PTEN; MMAC1; TEP1; phosphorothioate; antisense oligonucleotide; inhibition; protein phosphatase; tumour; diagnosis; inflammation; anticancer; anti-inflammatory; anti-infective; infection; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         in the phenomena of tumour suppression, tumour reversion, apoptosis and/or resistance to viruses. The invention may be useful for the development of compounds with a cytostatic, viruside, neuroprotective, nootropic or neuroleptic activity. The DNA sequences may be useful as probes and primers for detecting, indentifying, quantifying and/or amplifying nucleic acid, for example as one component of a gene chip, application of the component of a gene chip,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                     21-JUL-1999;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        modified_base
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human PTEN phosphorothioate antisense oligonucleotide #29543.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           22-MAY-2000

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes phosphorothioate antisense oligonucleotides that are targeted to the 3'-untranslated region (UTR) of the sequence encoding a human dual specificity protein phosphatase designated PTEN (also known as MWAC1 and TEP1), and hybridise specifically to the human PTEN nucleotide sequence given in AAZ91361. The antisense oligonucleotides have antisenser, anti-inflammatory and antinfective activities. The phosphorothioate antisense oligonucleotides can be used for diagnossis, treatment and prevention of PTEN-related diseases, e.g. infections, inflammation and tumours. The present sequence
                                                                                                                                                                                         Substrate for detecting helicase activity in a UL9 protein, comprises strand including a herpes replication origin sequence and another straincluding a complementary sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  07-DEC-2000

The UL9 substrates are useful for detecting UL9 helicase activity in combination with ICP8 and ATP and also for detecting the ability of a chemical entity to inhibit UL9 helicase activity. Immobilised UL9 substrate is useful for detecting herpes infected samples. AAA87951 to AAA87967 represent specifically claimed herpes replication origin sequences given in the present
                                                                        New antisense oligonucleotides targeting nucleic acids encoding PTEN, useful for treating diabetes, increasing insulin sensitivity, or decreasing insulin resistance, blood triglyceride or cholesterol levels
                                                                                                                                                                                                                                                                                                                               21-JUL-1999;

The antisense oligonucleotides are useful in modulating the function of nucleic acids encoding PTEN, ultimately modulating the amount of PTEN produced. The antisense compounds can used as diagnostics, therapeutics, prophylactics (e.g. to prevent or delay infection, inflammation or tumour formation), and as research agents and kits. The antisense compounds are also useful in treating diabetes, decreasing insulin resistance, increasing insulin sensitivity and decreasing blood triglyceride or cholesterol levels in a diabetic animal. The present sequence is an antisense oligonucleotide targetting the DNA encoding PTEN (also known as MMAC1/TEP1)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to antisense compounds, compositions and methods for modulating the expression of phosphoinositide phosphatase (PTEN). The antisense compound is used to inhibit the expression of PTEN in cells or tissues, preferably human, or rodent, such as mouse or rat, liver, kidney or adipose cells or tissues. It is used to treat a disease or condition associated with PTEN, such as a metabolic disease or condition, condition. It is also used to decrease blood glucose or insulin levels in an animal, preferably a diabetic human or rodent. It is also used to decrease insulin expression of PEPCK in cells or tissues. It is also used to decrease insulin resistance, or increase insulin sensitivity, in an animal, preferably a diabetic human or rodent. It is used to decrease blood triglyceride or cholesterol levels in an animal, preferably a diabetic human or solent. It is used to decrease blood triglyceride or cholesterol levels in an animal, preferably a preferably a diabetic human or rodent. It is also used to present sequence is an antisense oligonucleotide targetted to human PTEN present sequence is an antisense oligonucleotide targetted to human PTEN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Best Local Similarity Matches 15; Conserv

The invention is useful for diagnosis of Alzheimer's disease. By making the marker into a parameter, therapeutic agents for Alzheimer's disease can be screened. The invention provides a precise diagnosis of Alzheimer's disease can be screened. The invention provides a precise diagnosis of Alzheimer's

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to antisense compounds, compositions and methods for modulating the expression of PTEN (also known as MMACI and TEP1). The compound is useful for inhibiting the expression of PTEN in cells or tissues to treat diseases associated with their expression, e.g. metabolic diseases or conditions, type 2 diabetes or hyperproliferative conditions. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. The invention is useful in gene therapy. The present sequence is human PTEN DNA specific antisense of the conditions.
 AAZ65654 to AAZ69578 represent human biallelic markers from the presinvention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the investment of the investment of the present amplification primers for the biallelic markers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human genome, biallelic marker; high density disequilibrium map; genomic map; haplotype; phenotype; polymorphic base; genotyping; haplotyping; hybridisation; identification; characterisation; haplotyping; hybridisation; densitification; SNP; PCR primer; amplification; single nucleotide polymorphism; SNP; PCR primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New double-stranded oligomeric compounds that modulate PTEN expression, useful for diagnosing, preventing or treating conditions associated with PTEN, e.g. metabolic diseases, type 2 diabetes or hyperproliferative
                                                                                                                                                                                                                                                                                     21-APR-1998;

Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment. N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from

The siNAs may or may not CC comprise ribonucleotides and may be double or single stranded. They CC further comprise sense and antisense regions, or alternatively are CC assembled from a sense oligonucleotide and an antisense oligonucleotide. CC Specifically, the siNAs include short interfering RNA (siRNA, double-CC stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs CC deoxyribonucleotides, and can be chemically synthesised, expressed from a CC vector or enzymatically synthesised. The invention also relates to kits CC for the in vitro or in vivo delivery of siRNA; conjugates and/or CC complexes of siRNA; and vectors that express siNA. The siNAs are used to CC modulate expression of the PDGFr gene in cells, tissue explants or CC complexes of siRNA; and vectors that express siNA. The siNAs are used to CC organisms (e.g., by ex vivo gene therapy), or in grafts and transplants (correcting leukaemia and solid tumours, restenosis, polycystic kidney CC disease, broncholitis, glomerulonephritis and stroke. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification CC useful for drug screening, diagnosis, therapeutic target identification CC and validation, genetic engineering, pharmacogenomics, studying gene CC targeted double-stranded siNA, which is identical to the PDGFr transcript
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

The invention relates to short interfering nucleic acids (siNA) which CC downregulate expression of the human platelet-derived growth factor CC comprise ribonucleotides and may be double or single stranded. They CC comprise ribonucleotides and may be double or single stranded. They CC further comprise sense and antisense regions, or alternatively are CC assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siNAA). The siNAs CC san be unmodified or chemically modified, can contain CC deoxyribonucleotides, and can be chemically synthesised, expressed from a CC vector or enzymatically synthesised. The invention also relates to kits CC complexes of siNAA; and vectors that express siNA. The siNAs are used to complexes of siNAA; and vectors that express siNA. The siNAs are used to CC complexes of siNAA; and vectors that express siNA. The siNAs are used to complexes of siNAA; and vectors that express siNA. The siNAs are used to complexes of siNA; and vectors that express siNA. The siNAs are used to complexes of siNAA; and vectors that express siNA. The siNAs are used to complexes of siNAA; and vectors that express siNA. The siNAs are used to complexes of siNAA; and vectors that express siNA. The siNAs are used to complexes of siNAA; and vectors that express siNA. The siNAs are used to complexes of siNAA; and vectors that express siNA. The siNAs are used to complexes of siNAA; and vectors that express siNA. The siNAs are used to complexes of siNAS; and vectors that express siNA. The siNAs are used to complexes of siNAS; and vectors that express siNA. The siNAs are used to complexes of siNAS; and vectors that express siNAS; and transplants or complexes, bronchiolitis, glomerilonephicitisms. They may be used for transplants or complexes, bronchiolitis, glomerilonephicitisms. They may be used for the present sequence represents the upper strand of a human pDGFr-transcript transcript.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example 3; SEQ ID NO 185; 148pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC The invention relates to antisense oligonucleotides (ADM76030 and CC ADM76031) targeted to the human NEPHA gene (ADM76029), which encodes a CC novel brain-derived ephrin receptor (ADM76028). The NEPHA protein has CC 50.7% homology to the human EphA7 ephrin receptor and its gene is located CC on chromosome 1. Ephrin receptors are overexpressed in various cancers CC and it has been found that inhibition of NEPHA expression promotes apoptosis. The invention also relates to the NEPHA transcriptional CC control (promoter) region (ADM76037); recombinant vectors and host cells CC comprising the NEPHA promoter operably linked to a reporter gene; a CC method of screening for compounds which inhibit or activate transcription CC of the NEPHA gene; and pharmaceutical compositions comprising an CC cantisense oligonucleotide or a transcriptional inhibitor or activator. CC The antisense oligonucleotides and modulators of NEPHA transcription are useful for inducing apoptosis for the treatment and/or prevention of CC cancers in which NEPHA is overexpressed such as lung cancer, ovarian CC cancer, breast cancer, cervical cancer, prostate cancer, bladder cancer, Stomach cancer and colorectal cancer. Sequences ADM76379.

CC represent transcription factor binding sites within the transcriptional CC control region of the NEPHA gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

They use "nested PCR" on mRNA sequences unique to PSA and PSM and compared the results. PSA outer primers span portions of exon 4 and 5, yielding a 486 bp PCR product. The upstream primer (AAQ65541) starts at nucleotide 494 in PSA cDNA and the downstream primer (AAQ65542) starts at nucleotide 960. The inner primers are AAQ65543-44. The assay used PSA and PSM primers in order to determine the limit of detecton for the assay. There was a significantly higher level of detecton of tumor cells with PSM as compared to PSA. The PSM coding sequence is useful for suppressing or modulating the metastatic ability of prostate tumour cells to grow, or for eliminating them. (Updated on 25-MAR-2003 to correct PN field.)
                                                        gene for a structural protein of cartilage comprising a sequence identified in Table I (Page 18-31). Table I includes 179 primer sequences (see AAQ65728-Q65906). The sequences of Table IA are given in AAQ65907-Q65938. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                        Detecting genetic pre-disposition to osteoarthritis - involving mutation in cartilage protein genes, by ampl analysis of DNA and comparison with standards.
                                                                                                                                                                                                                                  Claim 18; Page 39; 112pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                           Prostate-specific antigen (PSA) outer primers (AAT36809-10) span portions of exons 4 and 5 of the PSA gene and yield a 486 bp fragment of PSA that enables differentiation between CDNA and possible contaminating genomic DNA. The upstream primer begins at nucleotide 494 in the PSA cDNA sequence and the downstream primer at nucleotide 960. They, and inner primers (AAT36811-12), were used for nested-PCR amplification of PSA cDNA. Results were compared with those obtd. using primers (see also AAT36813-16 and AAT36827-30) based on prostate- specific membrane (PSM) antigen cDNA (see also AAT36785) for the detection of prostatic hematogenous micrometastases and of circulation prostatic tumour cells. Detection levels were higher using PSM primers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DNA encoding alternatively spliced prostate-specific membrane antigen - useful to develop prods. for detecting haematogenous micrometastic tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Synthetic

The method can be used to detect carcinoma cells or prostate, breast, colon or lung cancer cells, and determine whether a subject has metastatic or late stage prostate cance

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       a sample, and comprises: (a) providing a sample containing nucleic acid,
a first oligonucleotide primer comprising a CAG repeat, a second
coligonucleotide primer comprising a CAG repeat and a polymerase and PCR
creagents; (b) preparing said nucleic acid so that it is amplifiable; (c)
amplifying the nucleic acid with the first and second primers; and (d)
detecting the amplified product. The method is used to distinguish
between the expression of genes in two or more biological samples, e.g.
body fluids, cells, solid tissue or solid and liquid foods. It can be
used in medical diagnostics, e.g. to differentiate between normal and
conditional diagnostics, e.g. to differentiate between normal and
conditional diagnostics and analysis of genome subsets containing
chasesed tissue or to assess the variation within monozygotic twin pairs.
The method allows the isolation and analysis of genome subsets containing
chaseses including Huntington's chorea. The method uses PCR suppression,
in which only fragments which contain a target repeat are efficiently
amplified. This allows accurate identification of differentially
suppressed personal procession of the pro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                        This is the nucleotide sequence of a PCR primer used for amplification in the method of the invention involving the human p33-ING1 protein. The CC ING1 gene encodes p33-ING1 which can be used to modulate the activity of, CC isolate or detect p53. Expression of the ING1 and p53 genes in a CC mammalian cell results in normal growth regulation anchorage-dependent CC growth and apoptosis as a response to irreversible DNA damage and other CC cellular insult Inhibition of expression of either gene results in a CC loss of cellular growth control, anchorage independent growth, inhibition CC of apoptosis and resistance to radiation and cytotoxic drugs. The p33-CC ING1 is a component of the p53 signalling pathway that cooperates with CC p53 in negative regulation of cell proliferation by modulating p53 CC eignalling pathway can therefore be regulated (both enhanced or Suppressed) by modulating p33-ING1 activity. The modulation of p33-ING1 activity can be used for the stimulation or restoration of the p53 cpathway in anti cancer therapy or for the suppression of the p53 pathway to defend sensitive tissues from genotoxic stress or for the generation constitution cell lines

The method is used for determining a quantitative measure of the expression of a gene of interest in a biological sample by determining a normalised RNA prevalent for the gene of interest. The invention also relates to a method for determining the effect of a treatment on a quantitative measure of the expression of a gene of interest, or of a panel of genes of interest, in a sample by determining a normalised RNA equivalent for the gene of interest in a first untreated sample and a second treated sample. The methods are used for quantitative gene expression, where determination of changes in gene expression provides a measure of the biological response to a treatment or drug. The method have uses in
                                                                                                                                                                                                                                                                                               Detecting presence of disseminated cell marker in a sample for diagnosing metastatic cancer, involves eliminating illegitimate transcription-positive cells from sample and detecting presence of mRNA encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Polymerase chain reaction; PCR; primer; amplify; detection; disseminated; cell marker; epithelial; metastatic cancer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
```

The sequences given in AAI71959-83 are primers which were used in the method of the invention for detecting the presence of a disseminated or marker in a sample. The method comprises eliminating illegitimate transcription-positive cells from the sample, and detecting the presence of mRNA that encodes the marker. The expression of epithelial cell markers in blood cells was examined by RT-PCR using these transcriptmarkers in blood cells was examined by RT-PCR using these transcriptspecific primers. The method is useful for detecting the presence of a

presence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match
                                                                                                                                                                                                             The invention relates to sialic acid binding immunoglobulin-like lectin (Siglec)-like gene (SLG) polypeptides and polynucleotides. SLG polynucleotides can be used to modulate the activity of the SLG protein in antisense therapy. The SLG protein conditions that can be treated are cancer and haematopoietic disorders such as aplastic anaemia, leukaemia and lymphoma especially myelogenous and chronic myelogenous leukaemia. The SLG protein or a peptide can be used in a vaccine to treat cancer. They are also used in drug discovery. The present sequence is reverse transcription PCR (RT-PCR) primer used in cloning and molecular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           disseminated cell marker in a sample, and for diagnosing metastatic cancer by detecting the presence of a disseminated cell marker for cells identified as from the primary cancer in a sample that does not cell to the cells identified as from the primary cancer in a sample that does not cell to the cells identified as from the primary cancer in a sample that does not cell to the cells identified as from the primary cancer in a sample that does not cell to the cell to the

                      The invention relates to a compound that is 8 - 50 nucleobases in length targeted to a nucleic acid molecule encoding Casein kinase 2-beta, and which specifically hybridises with and inhibits the expression of Casein kinase 2-beta, or which specifically hybridises with an 8-nucleobase portion of an active site on a nucleic acid molecule encoding Casein kinase 2-beta. Also included are: (1) a composition comprising the compound, and a carrier or diluent; (2) inhibiting the expression of Casein kinase 2-beta in cells or tissues by contacting the cells or tissues with the compound so that the expression of Casein kinase 2-beta in cells or that the expression of Casein kinase 2-beta is inhibited, and (3) treating an animal having a disease or condition associated with Casein kinase 2-beta by administering to the animal the new compounds or that the expression of Casein kinase 2-beta is inhibited. The antisense compounds are useful for modulating the expression of Casein kinase 2-beta and for treating diseases or conditions associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense oligonucleotides targeted to nucleic acid encoding kinase 2-beta, useful in diagnostic and research applications, or treating a disease or condition associated with the expression of kinase 2-beta.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   modified_base
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cytostatic; antidiabetic; antiinflammatory;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   hyperproliferative disorders, particularly cancer, such as breast can prostate cancer, or liver cancer. The antisense compounds are also use for diagnostics, therapeutics, prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits, and in distinguishing between functions of various members of biological pathway. The present sequence is an antisense oligonucleous of the invention targeting human casein kinase 2-beta
                                                                                                                                                                                                                                                      The invention relates to an isolated polypeptide designated prostate-
specific membrane (188M) antigen. The PSM antigen is useful in diagnos
preventing or treating prostate cancer in a patient or in isolating
homologous gene or genes in different mammals. The present sequence
                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated polypeptide designated as prostate-specific membrane antigen, useful for diagnosing, preventing or treating prostate o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            24-FEB-1995;

The yeast of the invention may be used for producing food and drink with enriched gamma-glutamyl cysteine or cysteine which is useful in food industry e.g. for seasoning. In this way, food and drink can be cheaply produced with improved flavour. The current sequence is that of the food enrichment-related PCR primer of the invention.

nasal airway dysfunction and a second active agent comprising an antinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or
                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel pharmaceutical composition, which has first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or
                                                           lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO

                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of CC junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC immunosuppressive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also CC entainflammatory steroid in a subject, for reducing or deflect of an CC antiinflammatory steroid in a subject, for reducing levels of adenosine creceptor, producing bronchodilation, increasing levels of bulquinone or CC lung surfactant in a subject; stissue, or treating bronchoconstriction, lung sulfamation, lung allergies, or a respiratory disease or condition. CC Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO or at fermine or condition in the printed specification, but was obtained in electronic format directly from WIPO

Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targ nucleic acids associated with lung airway or lung dysfunction bronchodilating agent. f adenosine, targeted to lung dysfunction, and

Claim 15; SEQ ID NO 2467; 763pp; English

Comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating composition, respiratory tract inflammation, allergies and creducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, composition or hyposecretion, when administered to a mammal. The coligonucleotides are derived from a gene encoding or regulating composition or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery composition of a target polypoptide associated with lung airway or lung composition or cancer and can be anti-sense to the corresponding mRNA. The invention has antiallergic, antiinflammatory, antiasthmatic, composition composition comprises of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypoptide present in the lungs. The composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypoptide present in the lungs. The composition on and/or bonchoconstriction and/or lung confilammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction.

CC inflammation, allergies, asthma, impeded respiration, respiratory conditions present in the target mRNA or to reduce the composition content of the anti-sense oligos corresponding to thyndines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system content and thereby, to prevent any unwanted effects due to it

```
Compression of a target polypeptide associated with lung airway or lung cysfunction or cancer and can be anti-sense to the corresponding mRNA.

Combined the invention also describes a kit, that comprises: (a) a delivery comprises: (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition comprises of the invention has antiallersic, antialinflammatory, antiasthmatic, can algesic, hypotensive, immunosuppressive and cytostatic activity, is a composition comprises oligo and is administered to reduce the smount of target polypeptide present in the lungs. The composition composition composition of the target mRNA or to creduce the amount of target polypeptide present in the lungs. The composition, allersies and/or bronchoconstriction and/or lung complianmation, allersies and/or bronchoconstriction and/or lung complianmation, allersies, asthma, impeded respiration, respiratory hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary compositions are reduced adenosine content of the anti-sense oligos corresponding to the oligonucleotides into products that free adenosine into the system content of the arriers to prevent the breakdown of the oligonucleotides into products that free adenosine into the system content and affect and the content of the content of the arriers that free adenosine into the system content and affect and the content and thereby, to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nyce JW,

                                                                                                 The present invention relates to an oligonucleotide anti-sense to e.g., initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-end of nucleic acid target comprising gene(s) chosen from e.g. interleukin (II)-4 receptor, II-5 receptor or salts of the oligonucleotide and optionally surfactant operatively linked to the oligonucleotide and optionally surfactant operatively linked to the oligonucleotide. The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy(ies), asthma, impeded respiration, cystic fibrosis (CP), chronic obstructive pulmonary diseases (COPD), allergic rhinitis (AR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway the production of a respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway the production of a respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway the production of a respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway the production of a respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, airway the production of a respiratory distress syndrome are production of a respiratory distress are p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                interleukin; IL-4 receptor; IL-5 receptor; lung disease;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention relates to a novel isolated polypeptide having the biological activity of an alternatively spliced prostate-specific membrane (PSM) antigen. The invention is useful for making prostate cells susceptible to a cytotoxic chemotherapeutic agent which involves contacting prostate cells with the polypeptide of the invention in an amount effective to render the prostate cells susceptible to the agent. In addition, the invention is useful for identifying ligands that bind PSM which are useful for imaging prostate cancer in human patients. The present sequence is that of a PCR primer which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 20 BP; 7 A; 7 C; 3 G; 3 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Isolated polypeptide having biological activity prostate-specific membrane antigen, useful for in imaging prostate cancer in human patient's.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      alternatively spliced; prostate-specific membrane; PSM; antigen. prostate cell; cytotoxic chemotherapeutic agent; prostate cances

                                                                                                                                                                                                                                                                                         S
                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel compound 8-80 nucleobases in length which is targeted to and specifically hybridises with a nucleic acid molecule encoding PTPRA (procein tyrosine phosphatase, receptor type alpha, LCA-related phosphatase; LRP; HLPR; HPTPA; PTPRL2; RPTPA) and inhibit the expression of PTPRA. The compound of the invention demonstrates cytostatic activities and may be useful for treating a disease or condition associated with PTPRA, such as a hyperproliferative disorder or metabolic disorder, as well as in research and diagnostics for modulating the expression of PTPRA. The current sequence is that of an antisense 2'-MOE (2'-methoxyethyl) gapmer oligonucleotide which was

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel compound 8-80 nucleobases in length which is targeted to and specifically hybridises with a nucleic acid molecule encoding PTPRA (protein tyrosine phosphatase, receptor type alpha, LCA-related phosphatase, LRP, HLPR, HPTPA, PTPRL2; RPTPA) and inhibits the expression of PTPRA. The compound of the invention demonstrates cytostatic activities and may be useful for treating a disease or condition associated with PTPRA, such as a hyperproliferative disorder or metabolic disorder, as well as in research and diagnostics for modulating the expression of PTPRA. The current sequence is that of a hyper property of the inventor which was targeted for actioned as the property of the current sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New compounds, particularly antisense oligonucleotides targeted to nucleic acid encoding protein tyrosine phosphatase receptor type al (PTPRA), useful for treating hyperproliferative or metabolic disord

                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                         S
                                                                                                                                                                                                                                                                                                                                                                                                CC chosen from a gene encoding interleukin (II)-4 receptor, interleukin (II)-6 receptor, CCR1, CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, CC tryptase a, tryptase b, PD84 A, PD84 B, PD84 C PD84 D. The invention CC also relates to a method of screening a candidate compound that binds to CC one or more nucleic acid target(s) or expressed product(s), for the prevention and/or treatment of a respiratory or lung disease. The CC oligonucleotides are useful for reducing or inhibiting expression of a CC gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CC CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, CC tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are CC useful for preventing or treating a respiratory or lung disease. The CC respiratory or lung disease is associated with hyper-responsiveness to and/or increased levels of, adenosine and/or levels of adenosine A CC and/or increased levels of, adenosine and/or levels of adenosine A CC inflammation or an inflammation, allergies associated with cC inflammation or an inflammation, allergy, asthma, impeded respiration, CC setic fibrosis (CP), chronic obstructive pulmonary disease (COPD), CC cystic fibrosis (CP), chronic obstructive pulmonary disease (COPD), CC oliging rightitis, acute respiratory distress syndrome, pulmonary CC bronchoconstriction. This sequence represents an oligonucleotide of the organization.
                                                                                                                                                                                                                                                                                                                              Matches
                                                                                                                                                                                                                                                                                                                                              Best Local
                                                                                                                                                                                                                                                                                                                                                            Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel single or multiple target oligonuclectide anti-sense to e.g. initiation codon, intron of respiratory disease-relevant gene e.g. CC RANYES, MCP4, useful for prophylaxis or treating respiratory disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (NYCE/)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention relates to novel methods for administration of protein therapeutic molecules so as to avoid inactivation through use of VHH antibodies derived from Camelidae antibodies. The invention may be useful for the production of compounds with antiinflammatory, cytostatic, gastrointestinal-Gen, antitubercular, tuberculostatic, virucide, antiallergic or immunosuppressive activity or for gene therapy. The polypeptide construct and method are useful for treating, preventing and/or alleviating disorders such as inflammation, colon, head, neck or lung cancer, indigestion, gastritis, tuberculosis, flu, allergies, transplant rejection or autoimmune disorder. These may also be used in preparing a medicament for treating, preventing and/or alleviating the above disorders. The present sequence is that of a PCR primer which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New VHH polypeptides derived from Camelidae antibodies directed against IgB, useful for preventing, treating or alleviating disorders such as inflammation, cancer, gastritis, tuberculosis, allergies or transplant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Silence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       sequence determined by Edman degradation. This probe was one of two (see also AAQ20341) designed based on the N-terminal sequence and was used in a Southern hybridisation of the PS3372 plasmid and total cellular DNA. A region of a positive band was amplified and used as a probe to clone the PS33F2 toxin gene. See also AAQ20336 and AAQ20343. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                  The present invention relates to toxins from Bacillus thuringiensis (see AAF23793-AAF23797 and AAB59881-AAB59885). The toxins have activity against hymenopteran pests e.g. carpenter, fire, argentine and pharaoh ants. The toxins can therefore be used to produce formicidal compositions for controlling ants, which are a better alternative to chemical insectides. The present sequence is a probe used to identify the toxins
                                                                                                                                                                                                                                                    Controlling hymenopteran insect new Bacillus thuringiensis and t
